“Ever Received a High School Degree”
by Structure of Family of Origin and by Current Religious Attendance

This chart looks at adults who have received a high school degree at the extremes of four demographic quadrants.

These four quadrants are derived from combining two sets of family structures (always-intact vs. non-intact*) and two sets of religious attendance (high vs. low).

The families occupying the four corners (or four extremes) of these quadrants are:
- The always-intact married family that worships weekly;
- The always-intact married family that never worships;
- The non-intact family* that worships weekly;
- The non-intact family* that never worships.

(* The non-intact group consists of women in the following categories: married stepfamily, cohabiting stepfamily, single divorced parent, and always single parent. In all these structures, there has been rejection between the biological father and mother, and thus the original pairing is no longer intact.)
“Ever Received a High School Degree”
by Structure of Family of Origin and by Current Religious Attendance

The 1997 National Longitudinal Survey of Youth shows that students who now worship weekly and who grew up with two married parents are most likely to have received a high school degree.

**Description:** Examining current religious attendance and structure of family of origin, 93 percent of students who grew up in intact married families and who attend weekly religious services have received a high school degree. Only 68 percent of students from all other family structures who never attend religious services received a high school degree. Eighty-nine percent of those who never worship but grew up in intact families and 81 percent of those who attend religious services weekly but come from other family structures received high school degrees.

Examining current religious attendance only, 87 percent of students who attend weekly religious services received a high school degree. In contrast, only 70 percent of those who never worship received a high school degree. Between these two extremes are those who attend at least monthly (81 percent) and those who attend less than monthly (76 percent).

Examining structure of family of origin, 91 percent of individuals who grew up with married biological parents received a high school degree. They are followed by those who grew up in a married stepfamily (80 percent), those who grew up with a single, divorced parent (76 percent), those who grew up in a cohabiting stepfamily (68 percent), those who grew up with an always-single parent (63 percent), and those who grew up in an intact cohabiting family (60 percent).

**Related Insights from Other Studies**

Nan Marie Astone and Sarah S. McLanahan, then of the University of Wisconsin at Madison, found that children from single-parent and stepfamilies completed high school at lower rates than children from intact married families.1 Another study found that two-parent families were conducive to children’s academic achievement.2

Another study affirms the importance of religious attendance for education. One study found that the more frequently youths attended religious activities, the more likely they were to give recognition to good grades, spend more time on homework, and have a positive attitude toward academics.3
